# Code Examples Are Everywhere

## 1.7 Recursive Functions

The sum of the digits of 18117 is  $1+8+1+1+7 = 18$ . Just as we can separate the number, this sum into the last digit, 7, and the sum of all but the last digit,  $1+8+1+1 = 11$ . This separation algorithm: to sum the digits of a number  $n$ , add its last digit  $n \% 10$  to the sum of the digits of  $n // 10$ . There's one special case: if a number has only one digit, then the sum of its digits is itself. This can be implemented as a recursive function.

```
>>> def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = n // 10, n % 10
        return sum_digits(all_but_last) + last
```

12:54 PM **wmcgrath** Hey, per discussion in the group chat, when you have some timeline "focus on the next time that line runs" in the timeline? We had the function complicated - here's the code from Bifrost

12:55 PM **wmcgrath** added this JavaScript/JSON snippet: [Untitled](#) ▾

```
1  if(!codeEditedSinceLastTrace){
2      var orig_line = row + 1;
3      // console.log(orig_line)
4
5      var beginningEventIndex;
6      if(cur_line==undefined){
7          beginningEventIndex = 0;
8      } else {
9          beginningEventIndex = cur_line.event_index;
10 }
```

This might be of interest:

222

```
function isElement(obj) {
    try {
        //Using W3 DOM2 (works for FF, Opera and Chrome)
        return obj instanceof HTMLElement;
    }
    catch(e){
        //Browsers not supporting W3 DOM2 don't have HTMLElement and
        //an exception is thrown and we end up here. Testing some
        //properties that all elements have (works on IE7)
        return (typeof obj==="object") &&
            (obj.nodeType===1) && (typeof obj.style === "object") &&
            (typeof obj.ownerDocument ==="object");
    }
}
```

It's part of the [DOM, Level2](#).

The screenshot shows a GitHub Gist page for a file named 'disable-back-swipe.js'. The file was created 5 years ago and has 5 stars and 0 forks. It contains a single line of JavaScript code: 'Disabling back history navigation with swipe (chrome)' followed by the code itself. The code uses jQuery to prevent double-tap zoom on scrollable elements in Chrome.

```
Disabling back history navigation with swipe (chrome)

disable-back-swipe.js
Raw
1 // http://stackoverflow.com/questions/15829172/stop-chrome-back-forward-two-finger-swipe
2 $(document).on('mousewheel', function(e) {
3     var $target = $(e.target).closest('.scrollable-h');
4     if ($target.scrollLeft () <= 4) {
5         $target.scrollLeft(5);
6         return false;
7     }
8 });
9
10
```

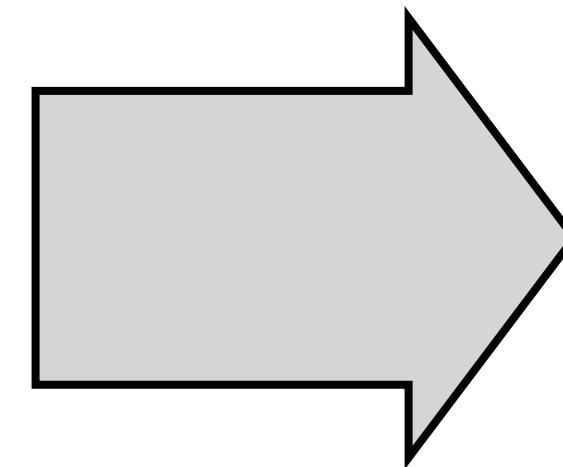

# Why Examples Matter

People learn more and do more work by copying and following examples and by working their way through exercises than by any other single activity...

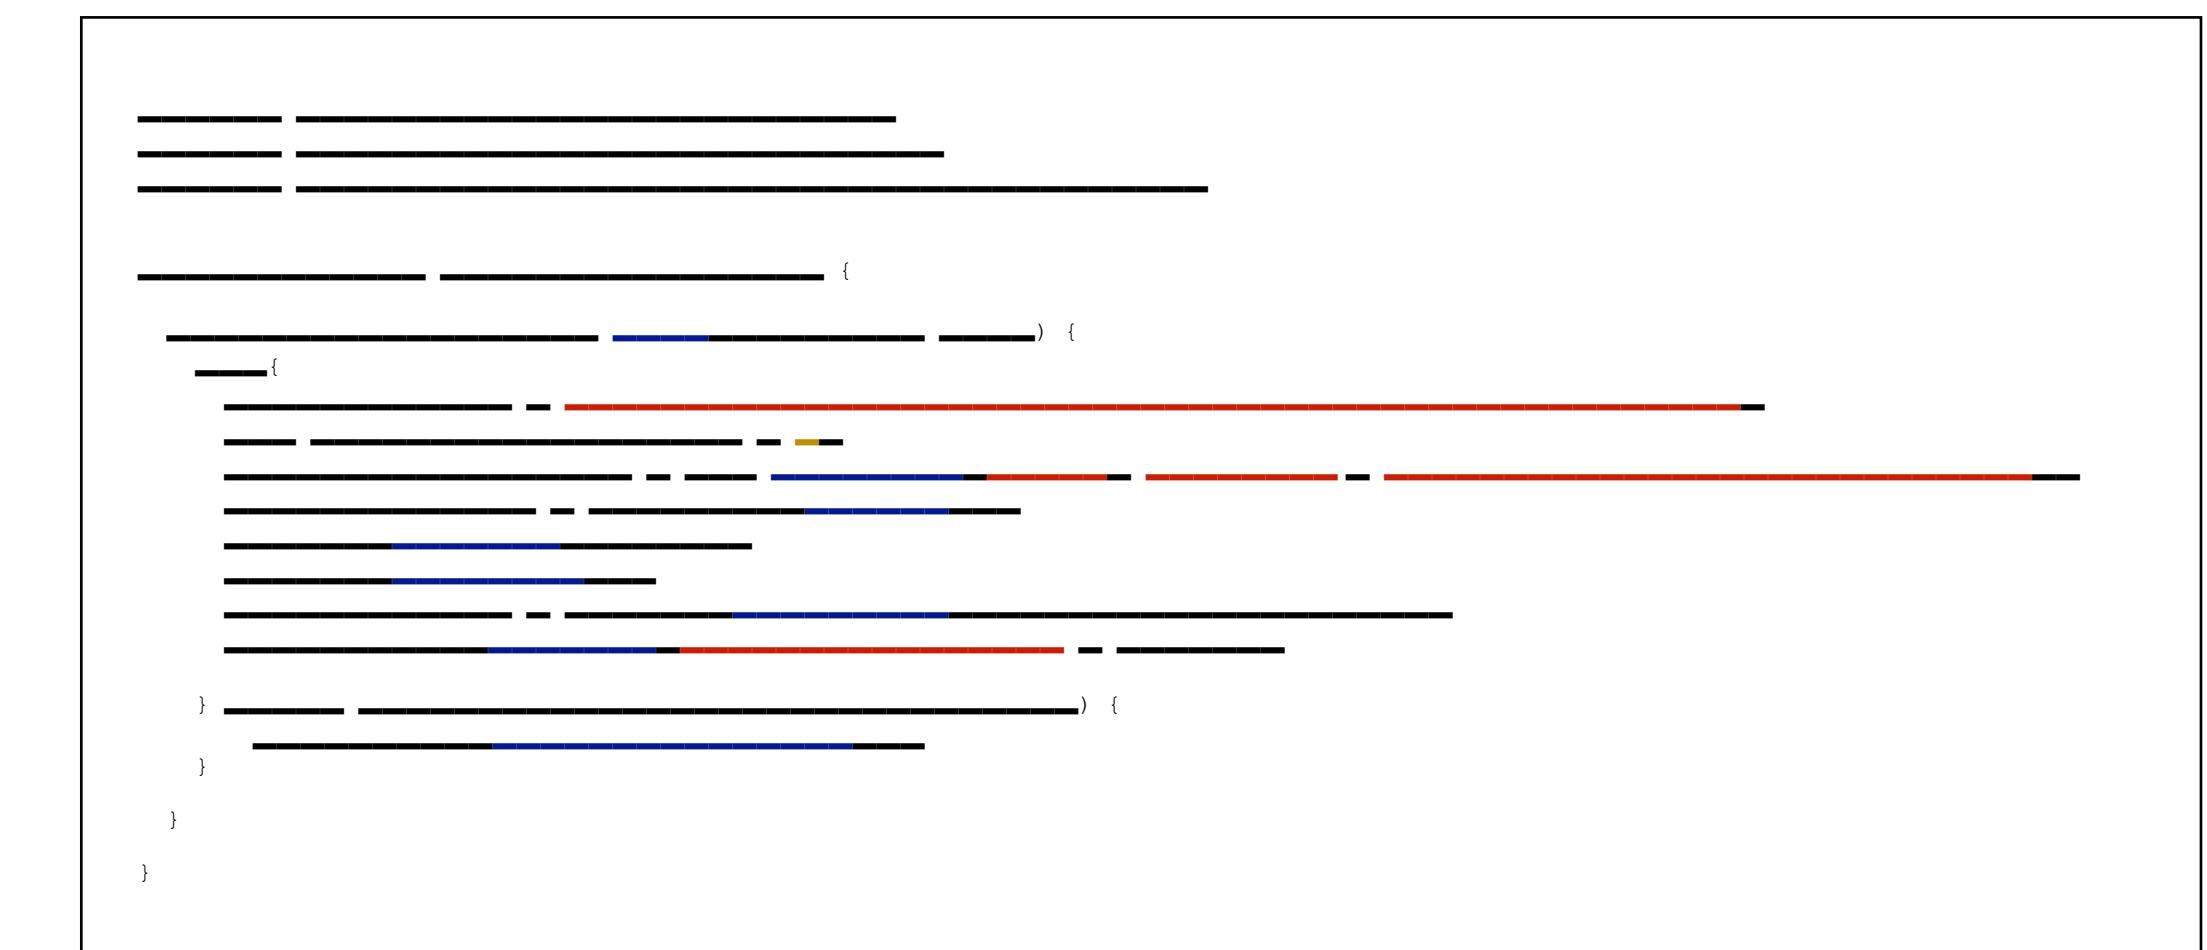

Marc Sacks, *On-the-Job Learning in the Software Industry*, 1994

# How can tools make it easier for programmers to share examples from their own code?

Detailed, personal code

Concise, self-contained example

Post online, share locally, ....

```
for ( _____ = _ ; _ < _____( _____, _____); ++  
    _____.fetchone();  
  
int id = cursor.getInt( _____ );  
  
    _____ = _____( _____ );  
  
    _____ = _____( _____ );  
  
Book book = new Book(id, _____, _____, _____);
```

A row of data is fetched from the database.

```
for (_____ = _; _ < _____(_____, _____); ++_____){  
    cursor.fetchone();  
  
    int id = cursor.getInt(_____  
        _____ = _____(_____  
            _____ = _____(_____  
                _____ = new Book(id,  
                    _____, _____, _____);  
    )};
```

A row of data is fetched from the database.

This is data for a book.

```
for (int i = 0; i < Math.min(rowCount, maxBooks); ++i) {
    Cursor cursor = database.query("Books", null, null, null, null, null, null);
    int id = cursor.getInt(COLUMN_INDEX_ID);
    String title = cursor.getString(COLUMN_INDEX_TITLE);
    int year = cursor.getInt(COLUMN_INDEX_YEAR);
    int numPages = cursor.getInt(COLUMN_INDEX_NUM_PAGES);
    Book book = new Book(id, title, year, numPages);
}
```

# **Example Code Is Often...**

**Inadequate:** Coders frequently face API learning obstacles due to inadequate examples (Robillard 2009).

**Incomplete:** It takes years to document all members of well-known APIs (Parnin et al. 2012).

**Broken:** Often, code examples don't compile (Terragni 2016) and lack important details (Treude and Robillard 2017).

# **Supporting the Sharing of Example Code**

**Example Extraction:**

Buse and Weimer 2012, Montandon et al. 2013, Moreno et al. 2015

**Example Creation:**

Oezbek and Prechelt 2007 , Ginosar et al. 2013, Kojouharov et al. 2004

**Example Search:**

Hoffman et al. 2007, Stylos et al. 2007, Brandt et al. 2010

**Example Reuse:**

Cottrell et al. 2008, Oney and Brandt 2012, Wightman et al. 2012, Doerner et al. 2014

# Supporting the Sharing of Example Code

Example Extraction:

Buse and Weimer 2012, Montandon et al. 2013, Moreno et al. 2015

Example Creation:

Oezbek and Prechelt 2007 , Ginosar et al. 2013,  
Kojouharov et al. 2004

Example Search:

Hoffman et al. 2007, S

Example Reuse:

Cottrell et al. 2008, O  
al. 2012, Doerner et a

CodeScoop blends these two areas!  
  
It uses **both automation and human input**, to produce concise, executable examples.

```
33

# **Formative Study**

*12 programmers creating  
examples from existing code.*

A screenshot of a dark-themed code editor interface. The main area shows several horizontal blue bars representing code lines. At the top, there is a toolbar with icons for edit, run, stop, and settings. A search bar is located at the top right. The title bar indicates the file is "Untitled.py — Edited". The status bar at the bottom shows "Line 3" and "Run Settings...".

A screenshot of a dark-themed code editor interface. The main area shows a list of reviews with numbers 1 through 12 on the left, each preceded by colored horizontal bars (pink, white, yellow). Below this is a code editor panel showing several lines of code. At the top, there is a toolbar with icons for edit, run, stop, and settings. A search bar is located at the top right. The title bar indicates the file is "Untitled.py — Edited". The status bar at the bottom shows "Line 3" and "Run Settings...".

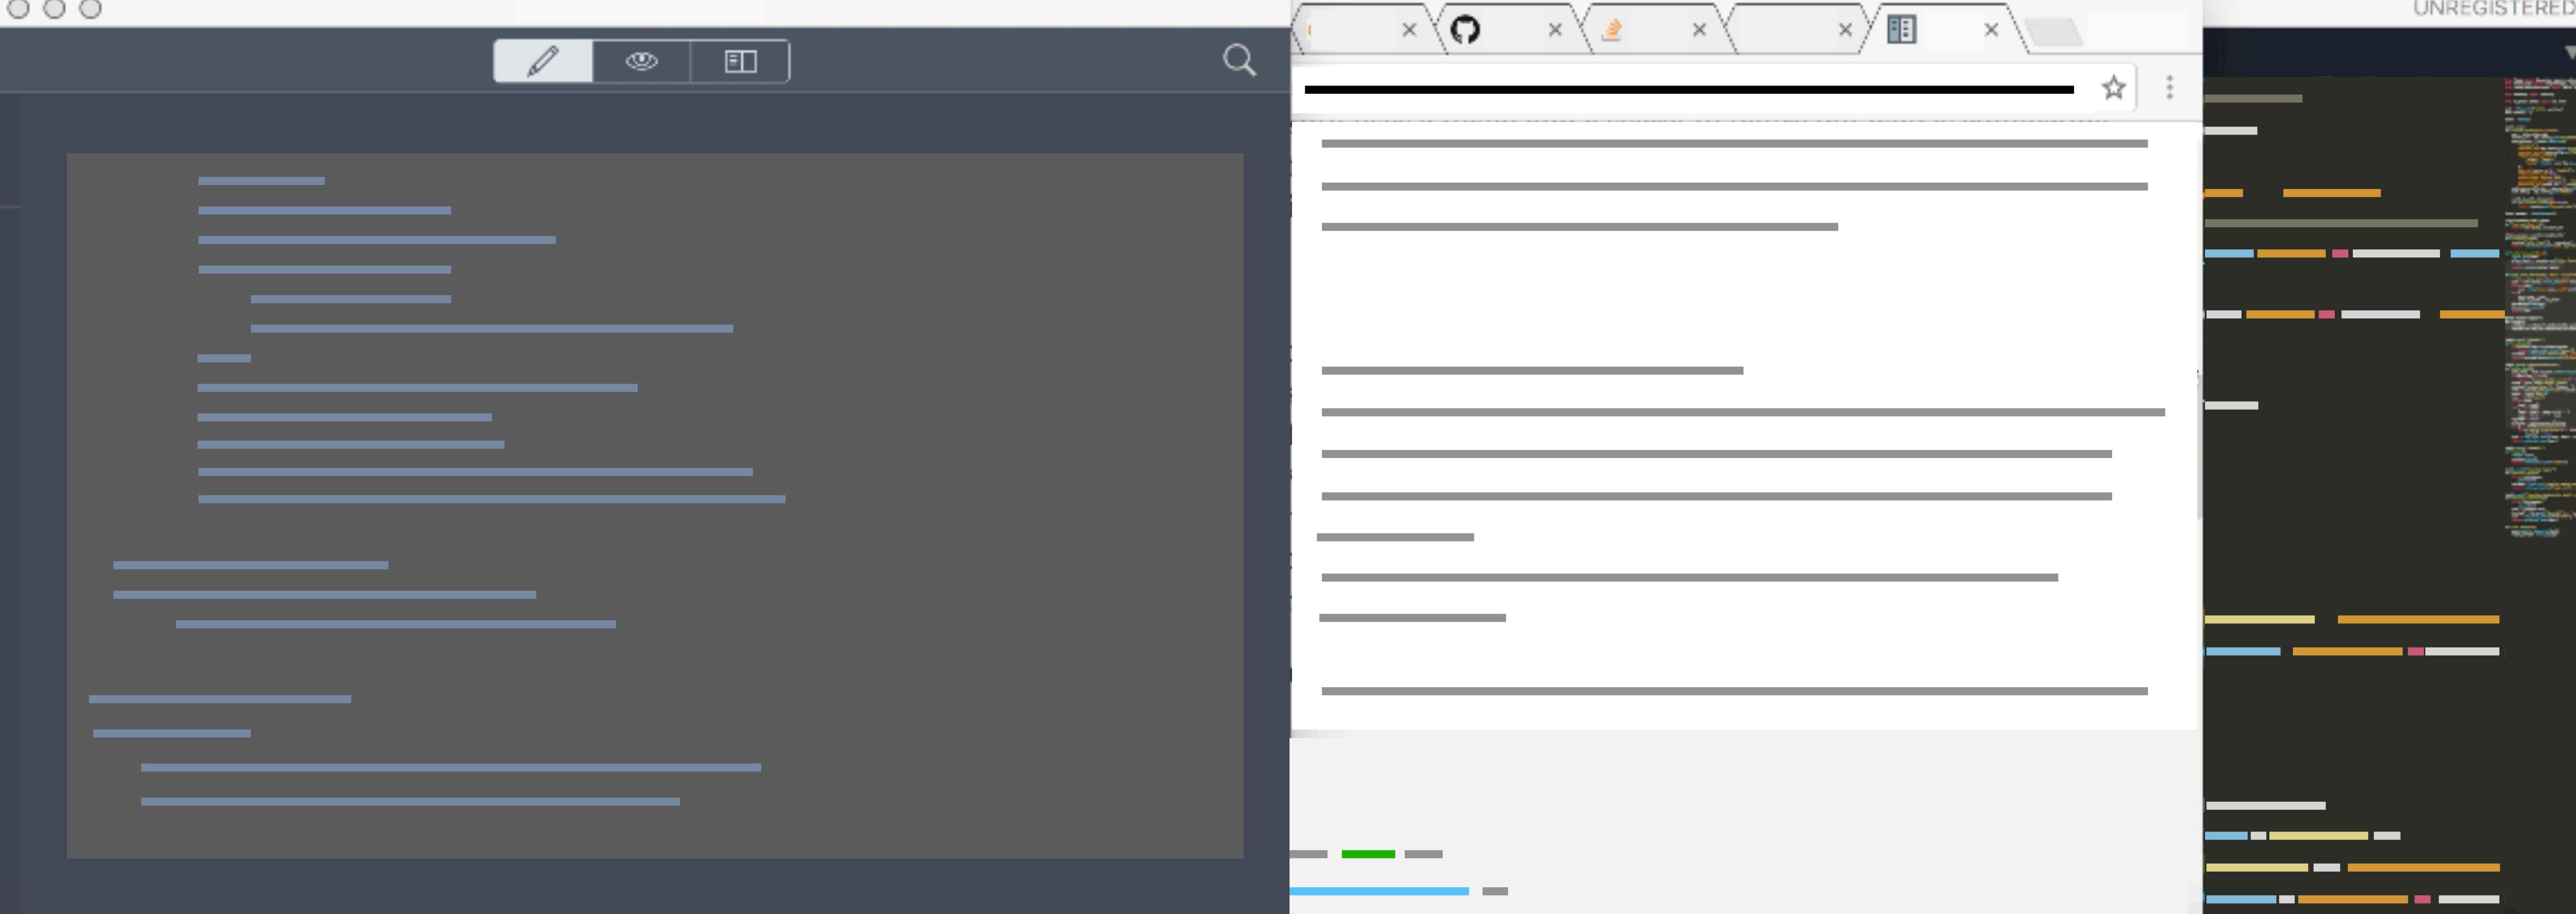

UNREGISTERED

A screenshot of a code editor window titled "Untitled.py — Edited". The main editor area contains numerous horizontal blue lines, likely representing code comments or placeholder text. The status bar at the bottom shows the language as "Python 3" and includes buttons for "Run", "Stop", and "Run Settings...". A blue box highlights the title bar of the editor.

Source Program

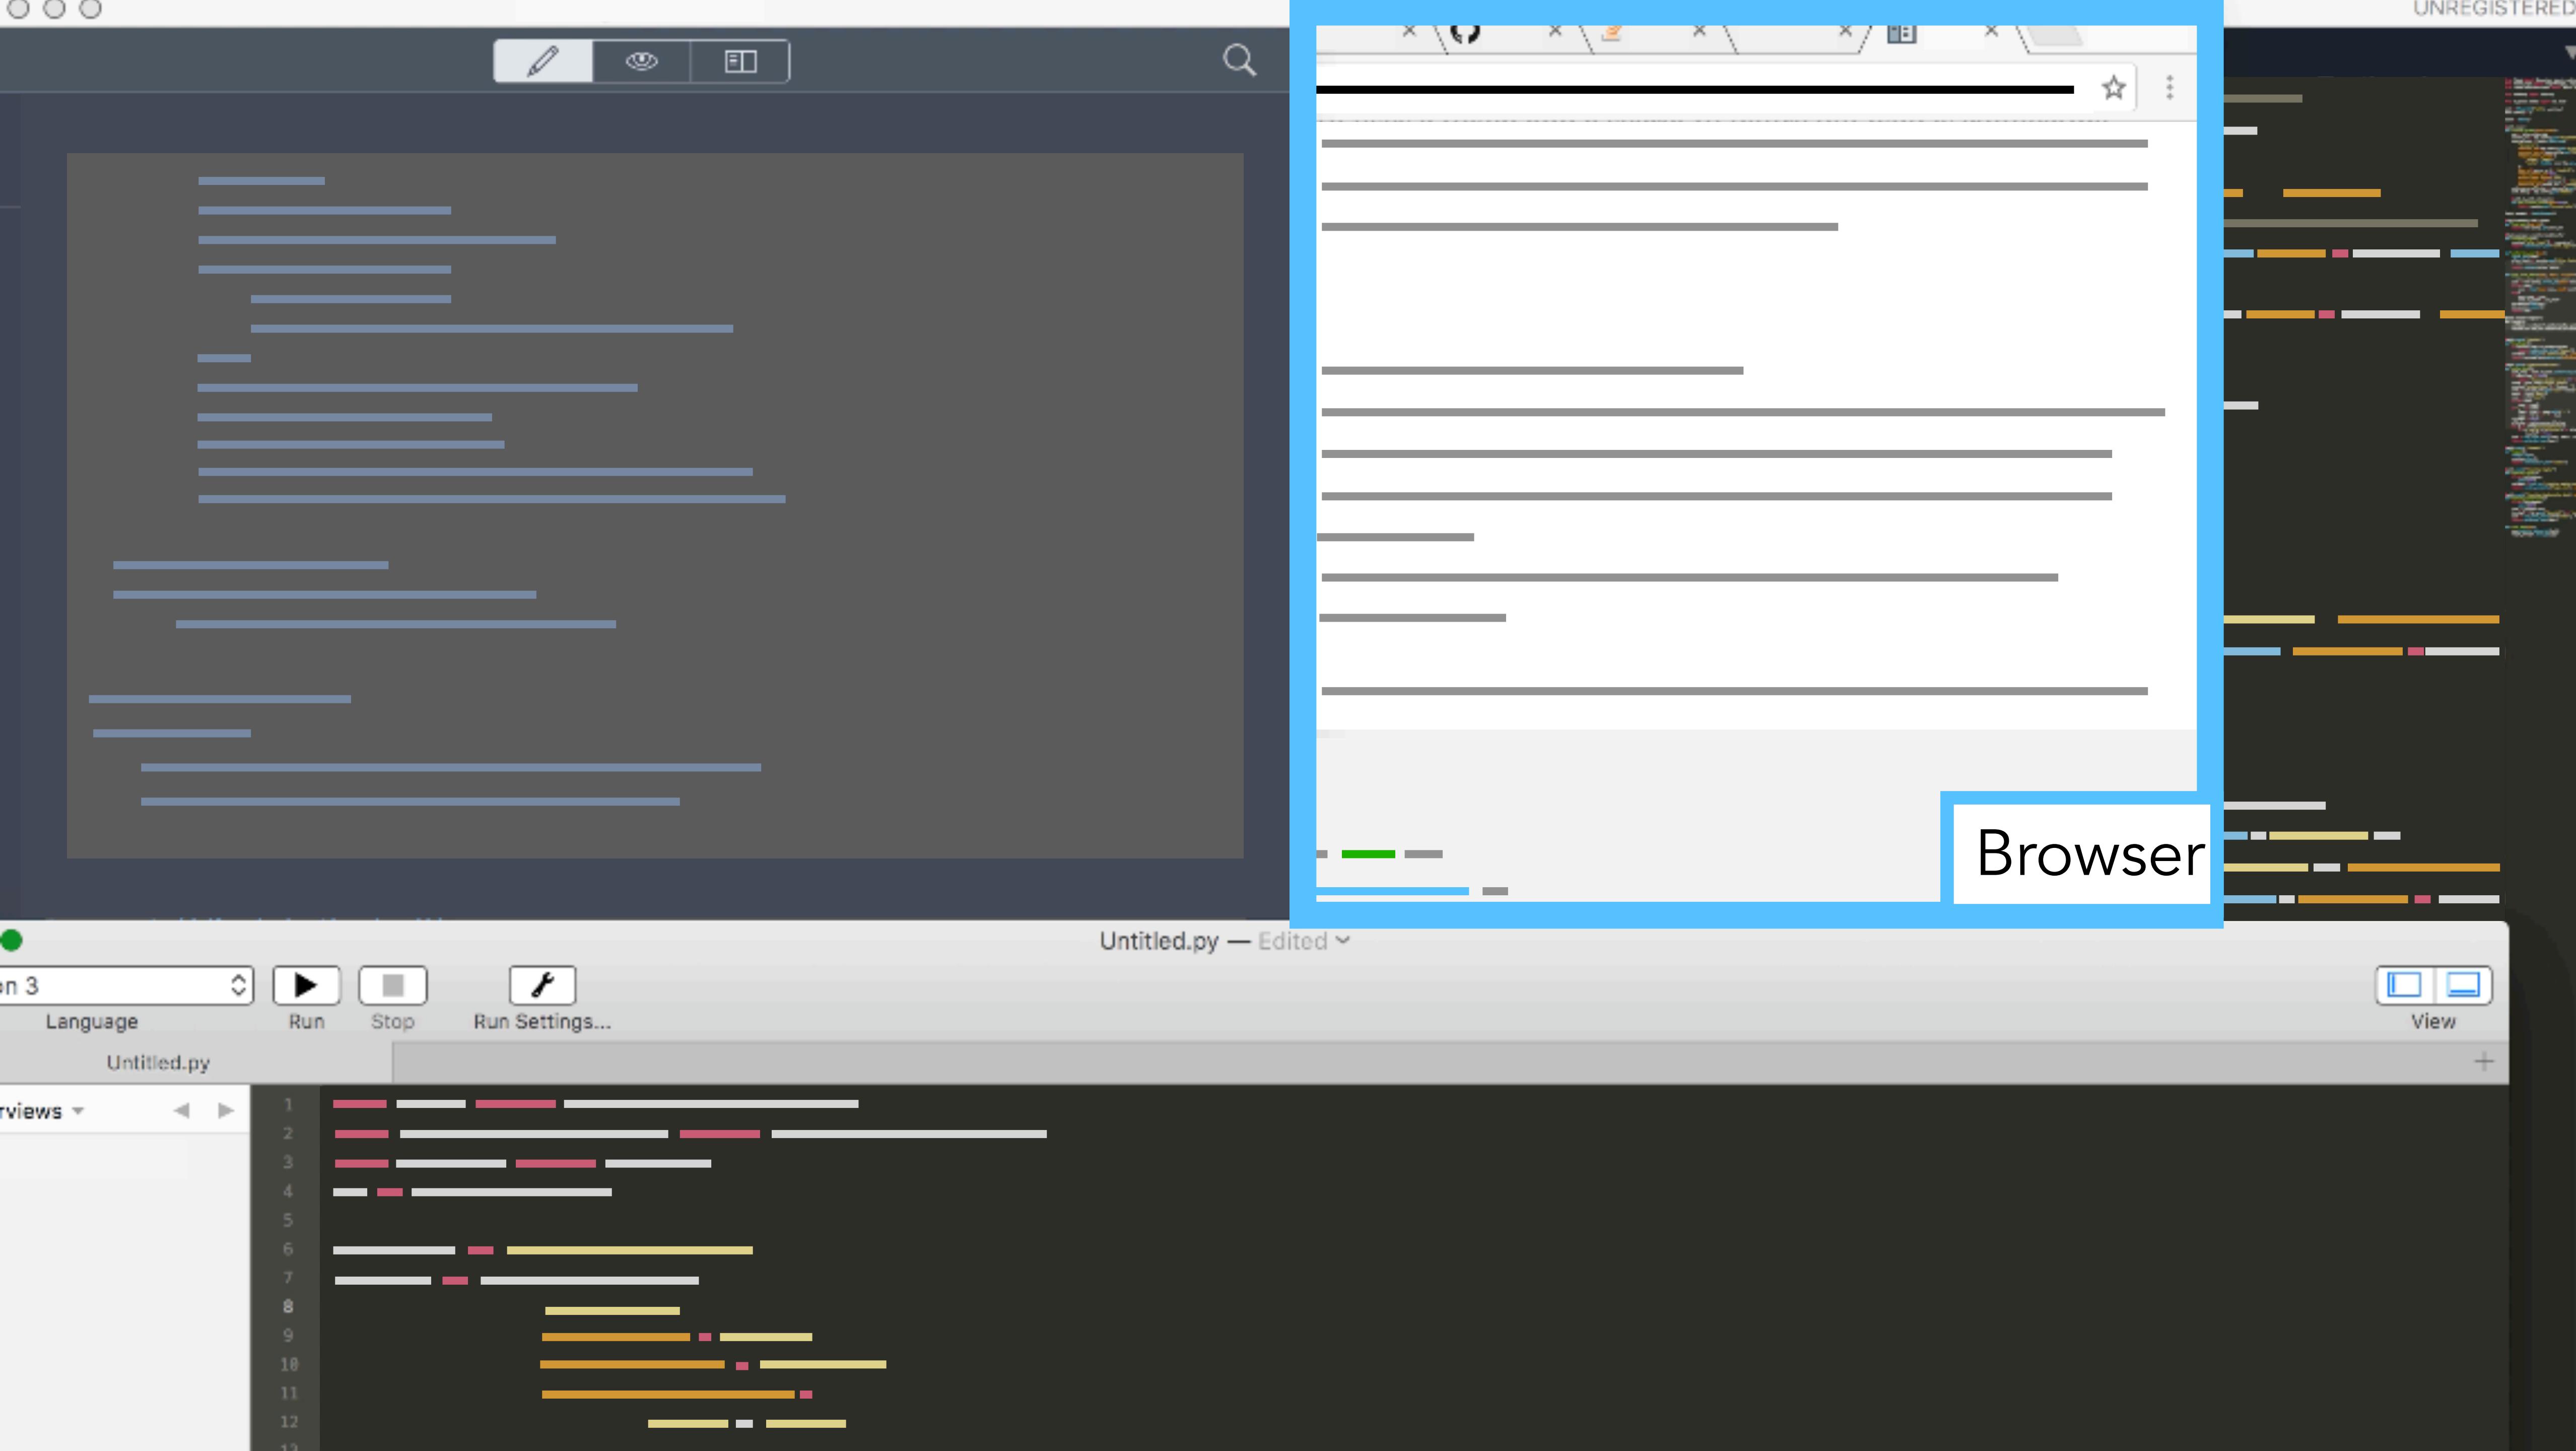

A screenshot of a code editor window titled "Untitled.py". The main editor area displays several numbered lines of code, starting with "1", "2", "3", "4", "5", "6", "7", "8", "9", "10", "11", "12", and "13". Lines 1 through 4 show pink and white horizontal bars. Line 6 shows a yellow bar. Lines 9, 10, 11, and 12 show orange bars. Lines 13 and 14 show yellow bars. The status bar at the bottom shows the language as "Python 3" and includes buttons for "Run", "Stop", and "Run Settings...".

UNREGISTERED

RQ. How can tools make it easier for programmers to share examples from their own code?

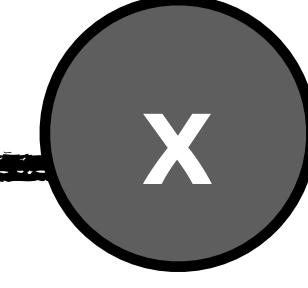

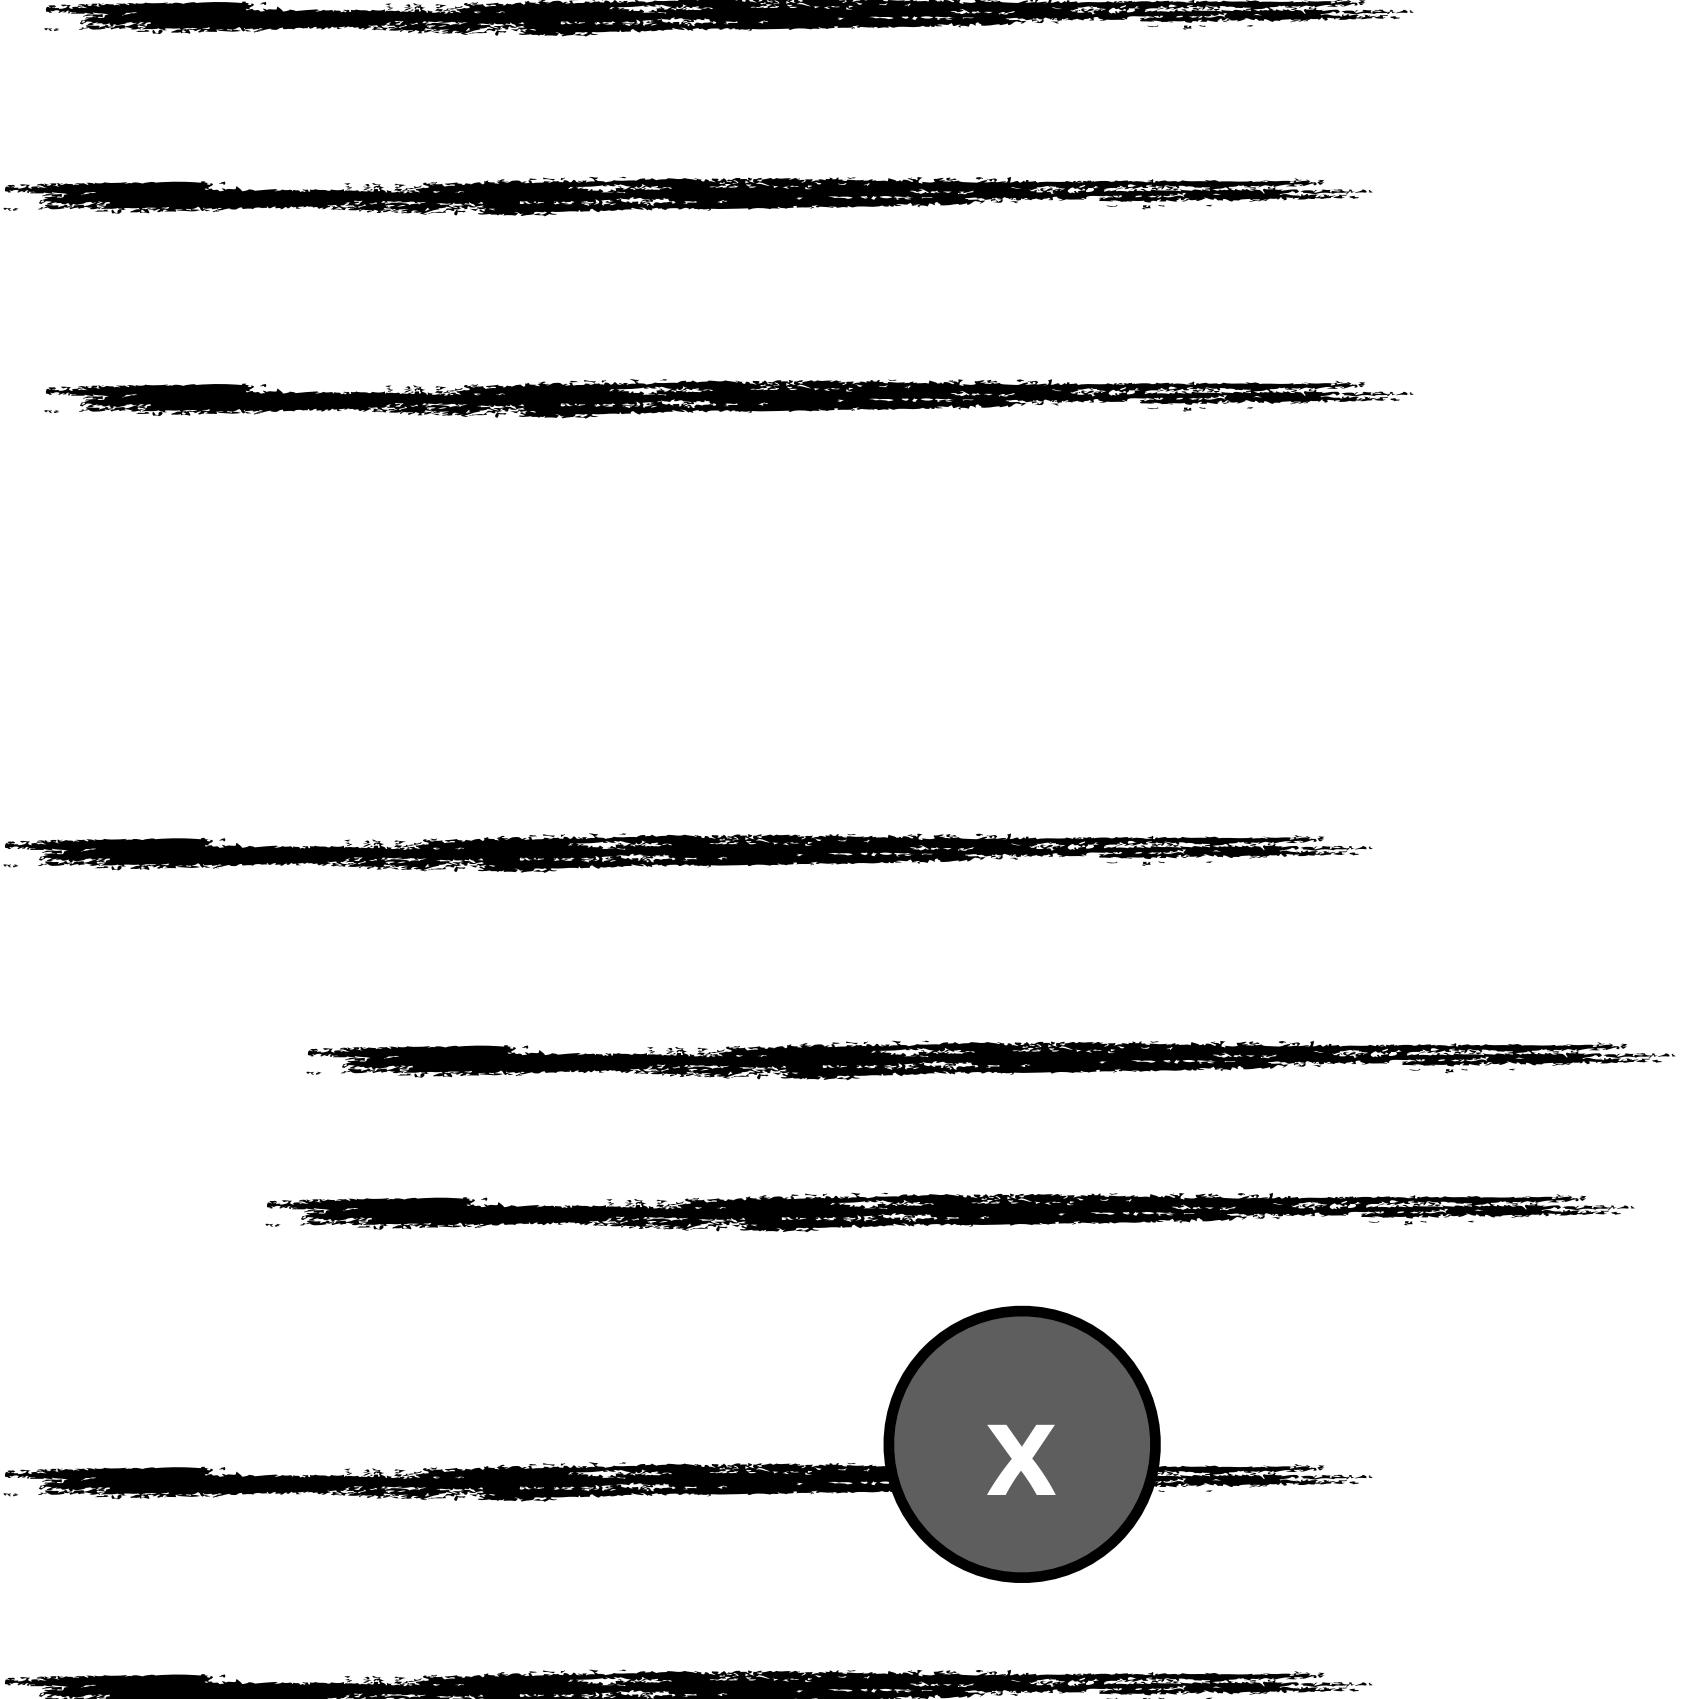

222

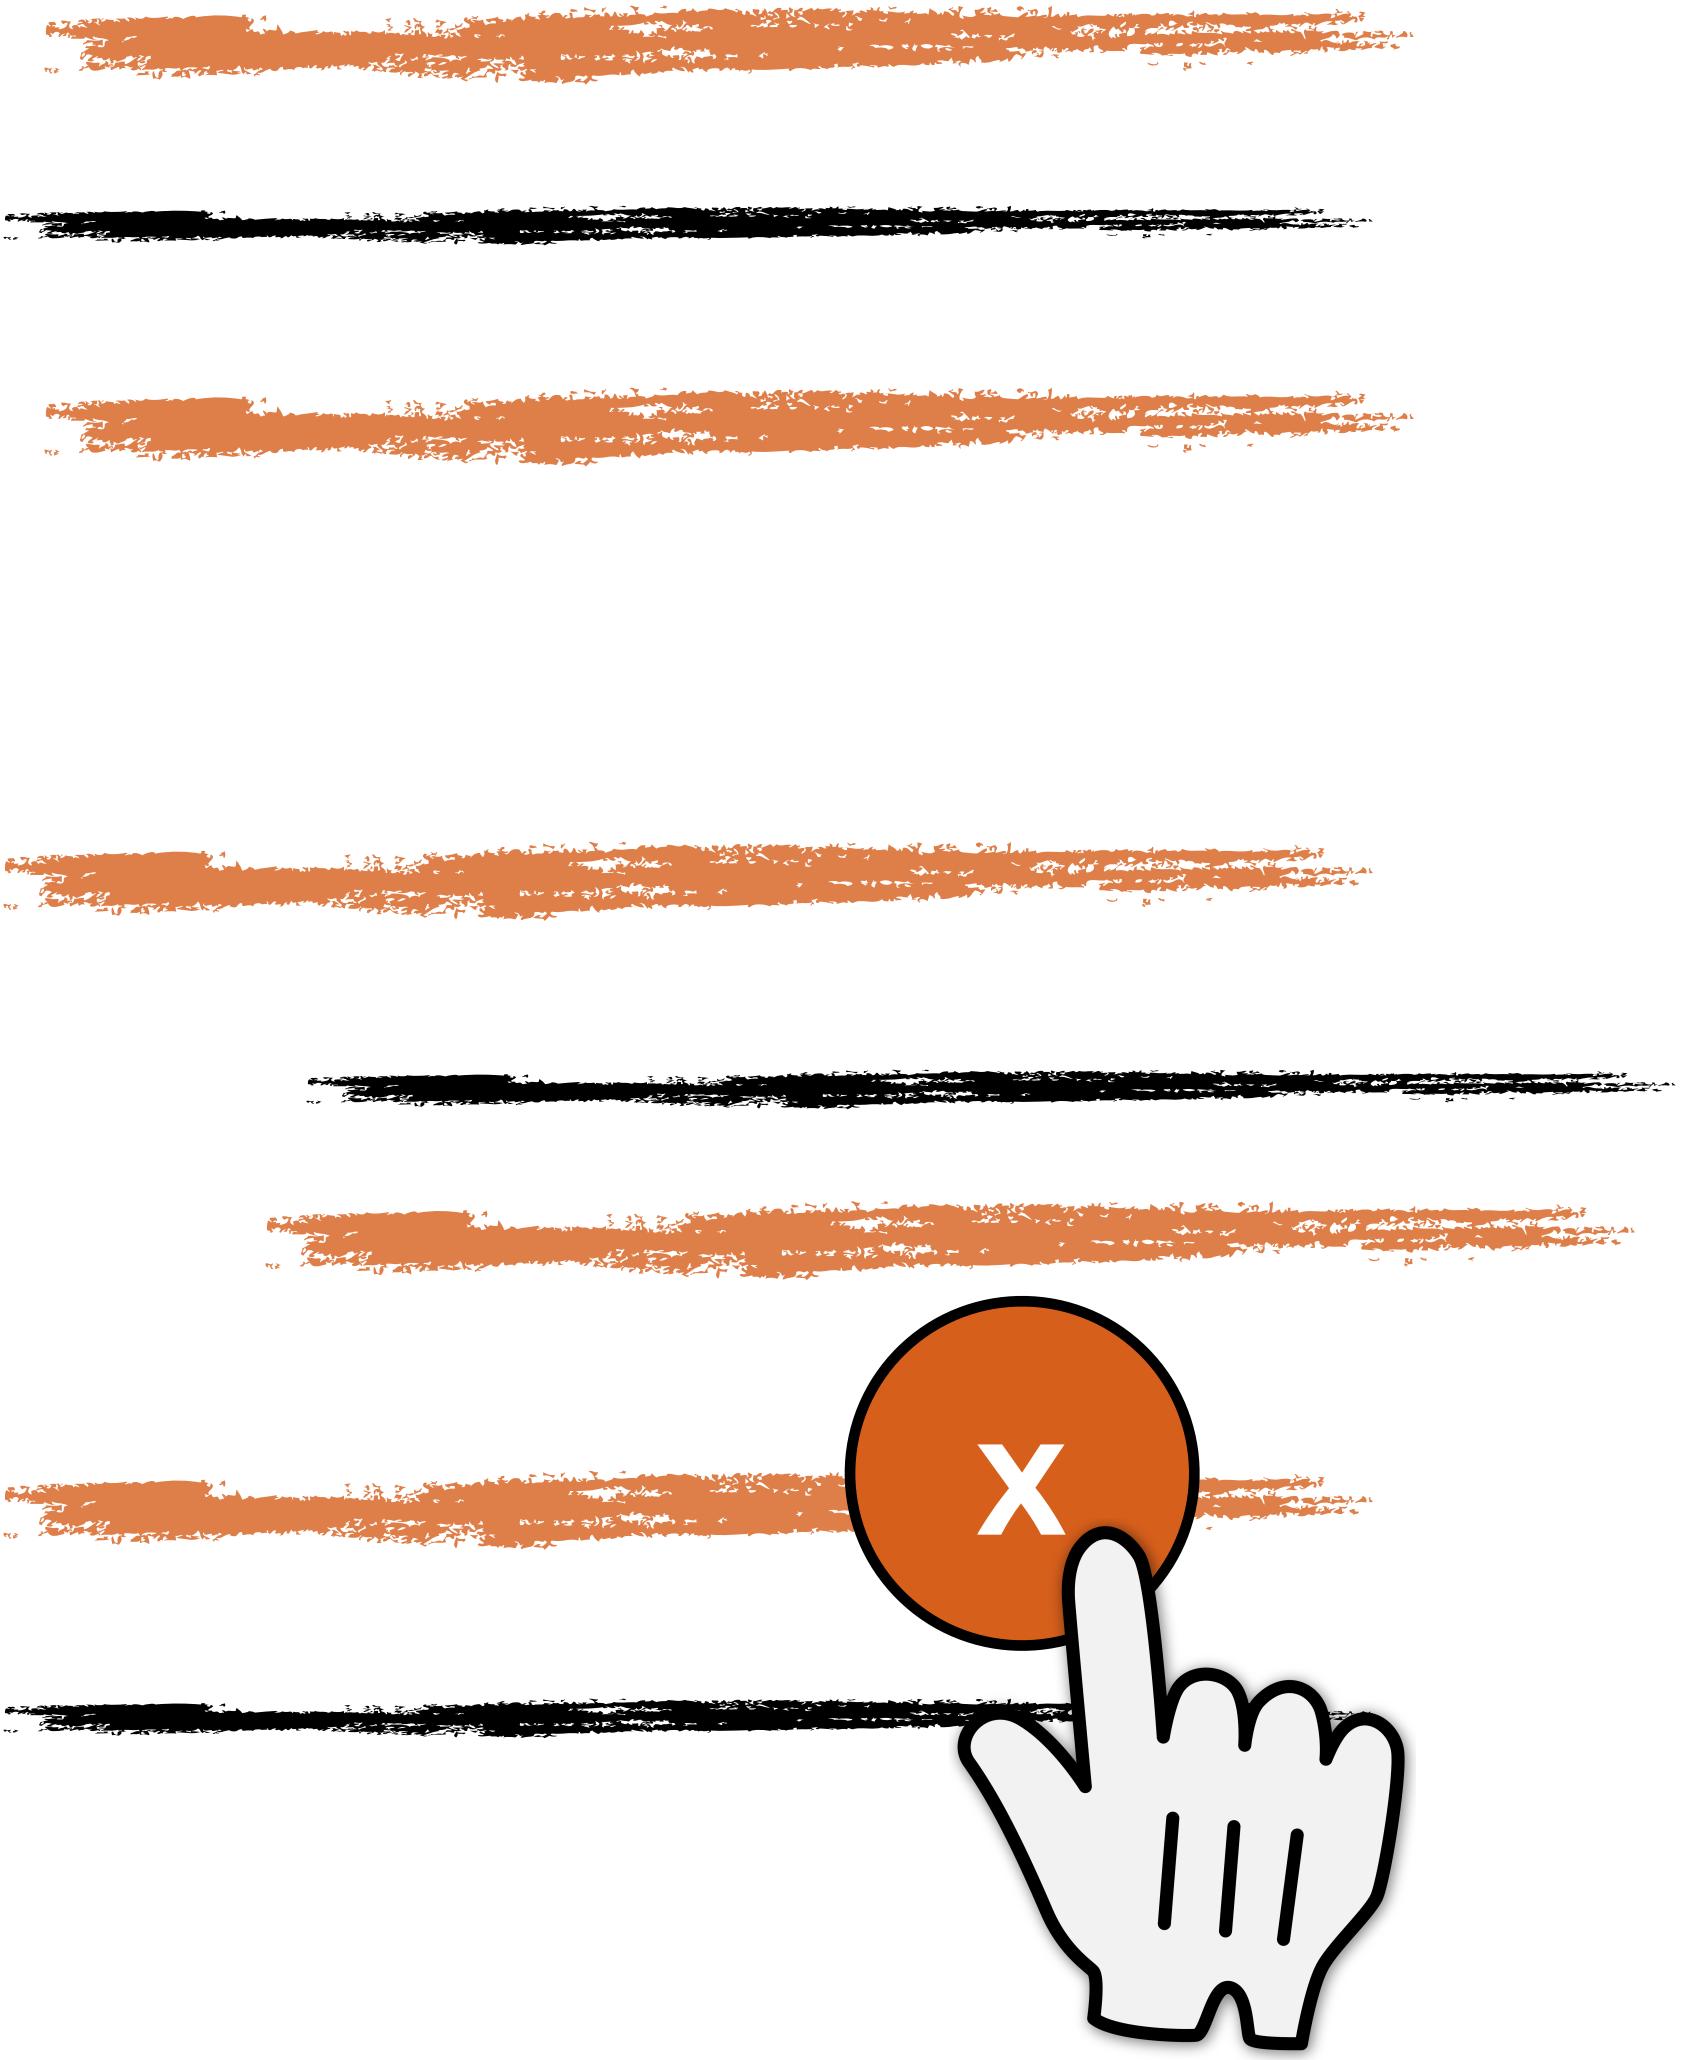

### We hypothesize that tools should:

- Suggest lines of code that the current example needs to run
- Constrain manual code edits
- Enable early and frequent testing
- Omit code except for explicit code selections and fixes

3 >     public static void main(String[] args) {  
4  
5 >         String title = cursor.getString(COLUMN_INDEX_TITLE);
```

- ! Create constant field 'COLUMN\_INDEX\_TITLE' in 'ExtractedExample'
- ! Create class 'COLUMN\_INDEX\_TITLE'
- ! Create field 'COLUMN\_INDEX\_TITLE' in 'ExtractedExample'**
- ! Create inner class 'COLUMN\_INDEX\_TITLE'
- ! Create local variable 'COLUMN\_INDEX\_TITLE'
- ! Create parameter 'COLUMN\_INDEX\_TITLE'
- ! Rename reference
- Split into declaration and assignment

**Add the definition of COLUMN\_INDEX\_TITLE from the source**

Sometimes the most useful fixes come from the source program (Euklas, Dörner et al. 2014)

```
34     int rowCount = cursor.rowCount();
35
36     while (finished == false) {
37
38         int i = 0; i < Math.min(rowCount, maxBooks); ++i) {
39
40             cursor.fetchone();
41             int id = cursor.getInt(COLUMN_INDEX_ID);
42             String title = cursor.getString(COLUMN_INDEX_TITLE);
43             int year = cursor.getInt(COLUMN_INDEX_YEAR);
44             int num_pages = cursor.getInt(COLUMN_INDEX_NUM_PAGES);
45             Book book = new Book(id, title, year, num_pages);
46
47             if (title != null) {
48                 titles.add(title);
49             }
50             if (id != -1) {
51                 boolean bestseller = isBestseller(book.getId());
52                 if (bestseller) {
53                     booklist.hasBestseller = bestseller;
54                 }
55             }
56
57             if (DEBUG == true) {
58                 System.out.println("Fetched books: " + titles + " / " + conn.createStatement().executeQuery("SELECT COUNT(*) FROM books").getResultSet().getInt(1));
59         }
60     }
61 }

# Combining Code Analyses into an Integrated Tool

# **Evaluating CodeScoop**

**Q1.** How does CodeScoop compare to a standard text editor for extracting example code?

**Q2.** Should CodeScoop be making decisions about fixing code automatically?

...

# **A Pilot Study about Example Code Extraction**

**Participants:**  $N = 19$  undergraduate student programmers

**Main Task:** Create examples from existing code

**Measurements:** Usability of CodeScoop vs. baseline text editor, Preference for their scoop vs. an automatic slice, time to extract an example, ...

**Qualitative Feedback:** Survey and Interview

# Was CodeScoop, vs. the baseline...?

Faster to use?	Yes.	5.8 min vs 9.6 min	p < .001
Easier to use?	Yes.	$\Delta = 3$ (7-pt scale)	< .01
More enjoyable?	Yes.	$\Delta = 3$ "	< .01
Producing more satisfying examples?	Yes.	$\Delta = 2$ "	< .01

"[CodeScoop's features] made creating an example a lot easier because I just had to look at the relevant code and see if I needed it or not instead of having to manually add them in."

**CodeScoop provided a median of...**

- 12 automatic corrections
- 5 suggestions of optional code
- 2 suggestions of error fixes

# CodeScoop Enabled Meaningful Simplifications

For Task 3, participants made an important simplification:

Slice (101 lines)

Scoop (median = 36 lines)

# No Consistent Heuristics for Automating Extraction

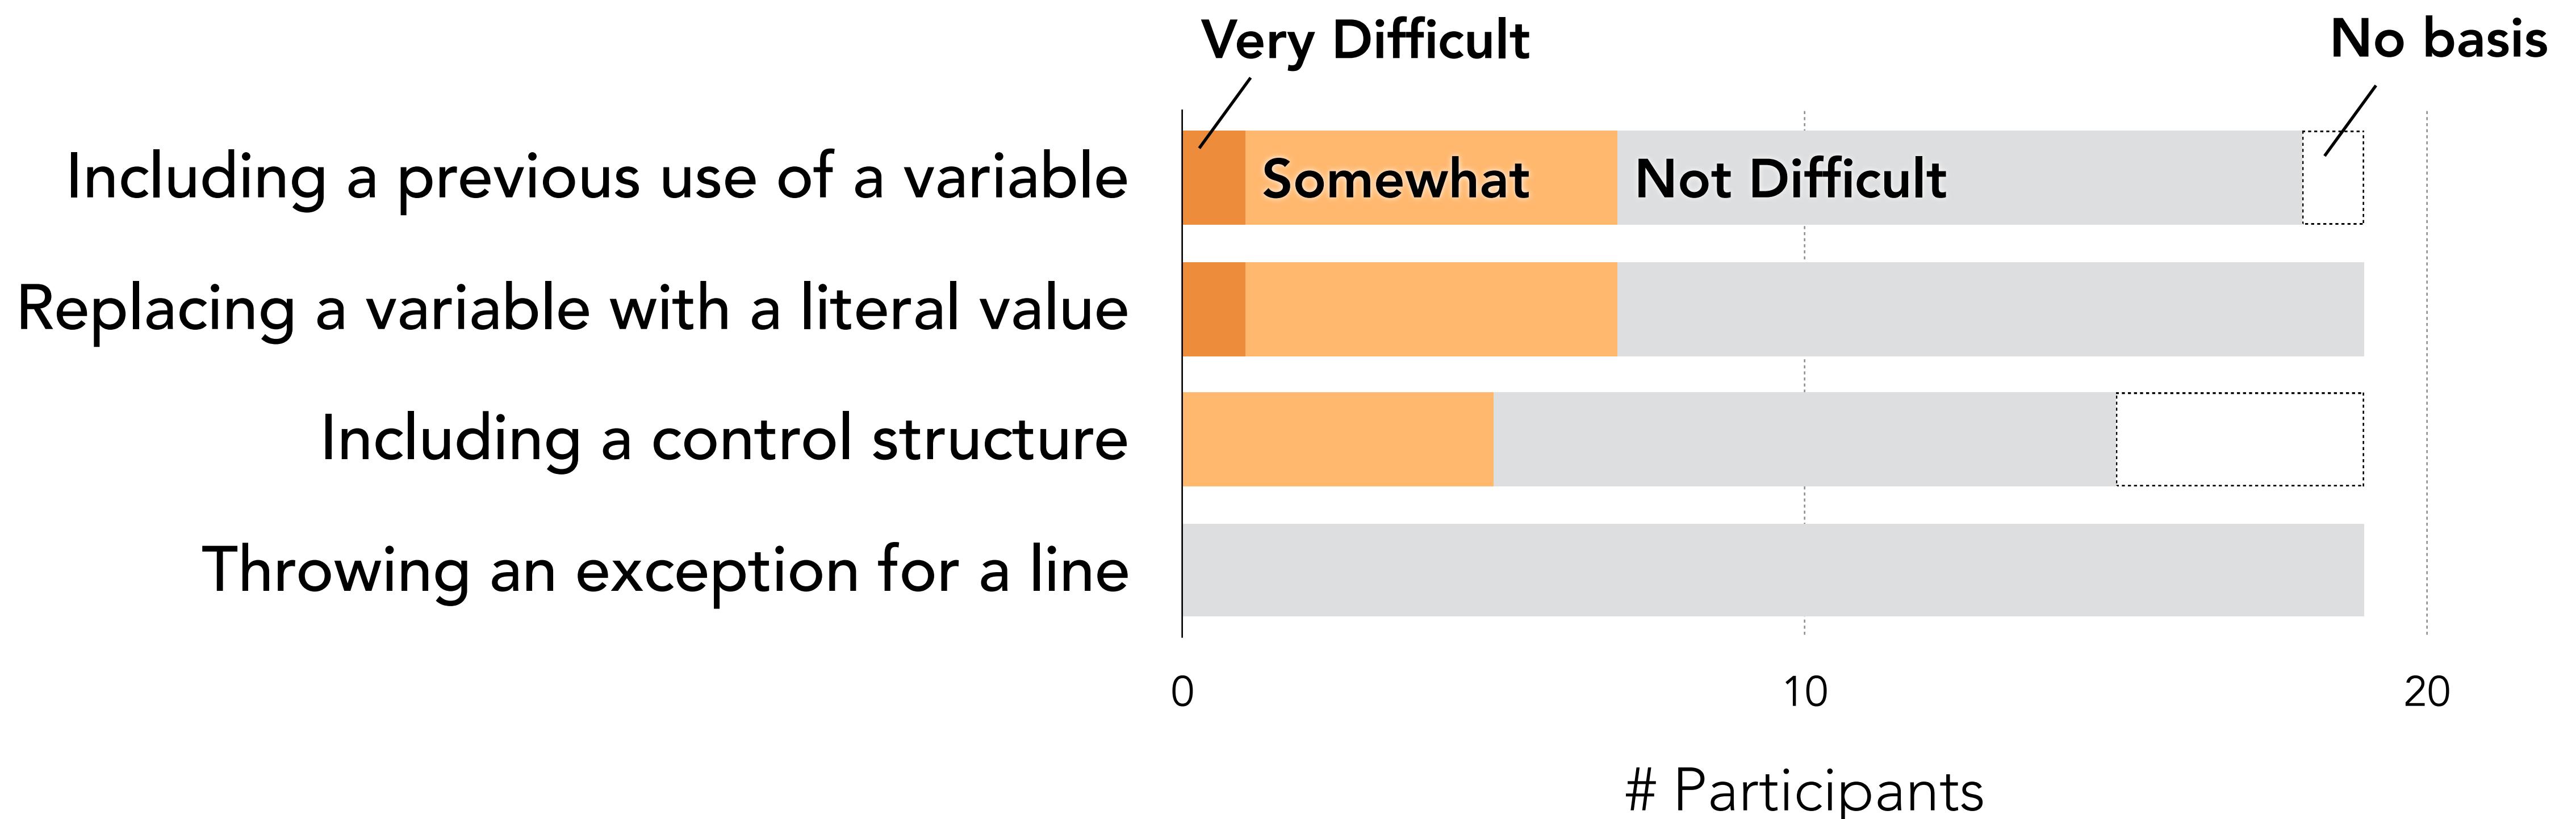

```
try {  
    if cursor.rowCount() > 0) {  
} catch (ConnectionException exception) {  
}  
}  
}
```

```
    _____  
    _____  
    _____  
    _____  
    _____ {  
  
int COLUMN_INDEX_TITLE = 1;  
  
    _____ - - - - -  
    _____ - - - - -  
    _____ - - - - - " "  
    _____ - - - - -  
    _____ - - - - -  
  
String title = cursor.getString(COLUMN_INDEX_TITLE);  
  
    _____ - - - - -  
  
Book book = new Book(__ title, __ );  
  
    _____  
}  
}
```

# Choice: **Error checking** through exceptions and postconditions.

Choice: Column **variable names**,  
saving results to **Book** object.

# Not All Authoring Decisions Were Easy

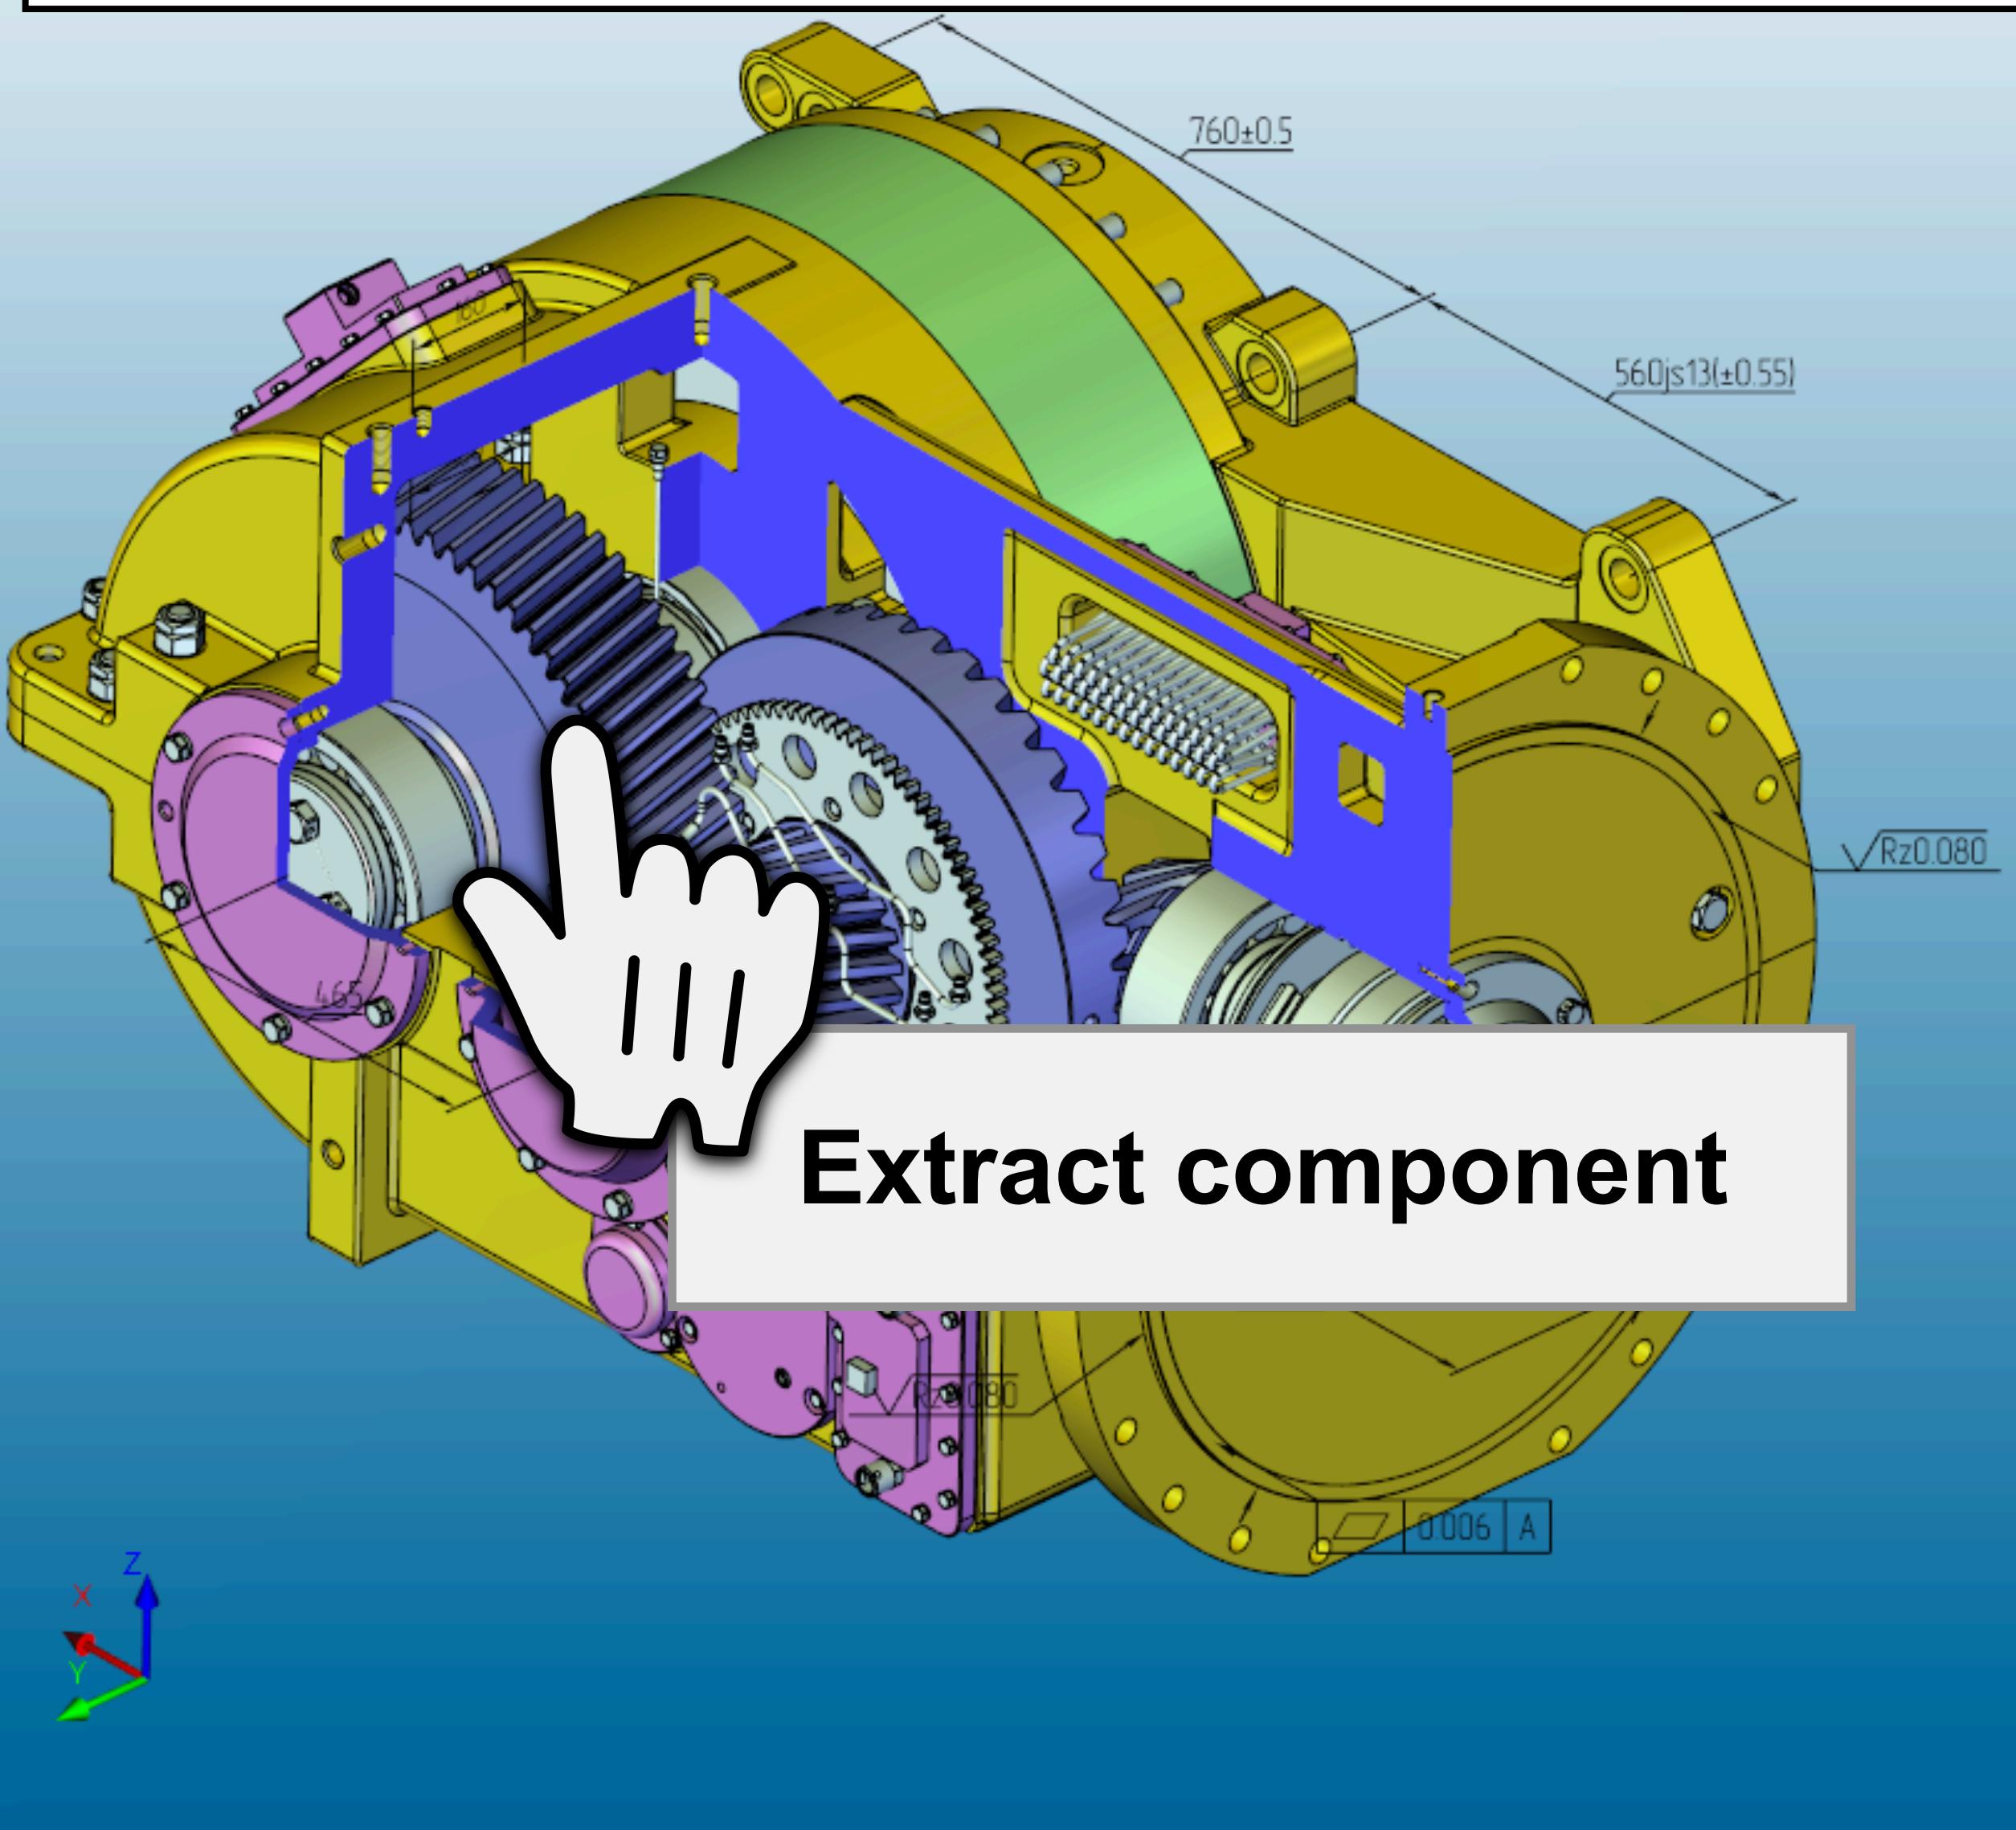

## **Takeaways from Study**

**Q1.** Scooping with our prototype was easier than using the baseline text editor.

**Q2.** Scooping has advantages over slicing: authoring choices, and sometimes conciseness.

The same easy pastry batter makes the light and airy confections we know as cream puffs, and chocolate éclairs. Cream puffs, round and fat, are filled with whipped cream and dusted with a blizzard of confectioners' sugar. Pipe the batter into longer ropes, you end up with log-shaped éclairs, ready to be filled with pastry cream and drizzled with chocolate icing.

Baking gluten-free? For great results, substitute [King Arthur Gluten-Free Measure for Measure Flour](#) for the all-purpose flour in this recipe; no other changes needed.

# Pilot Study Task Design

A screenshot of a Stack Overflow question page. The question title is "How do you get a row from a database in Java?". The question text asks: "I'm currently trying to use the `Cursor` class from the `org.acme.database` package. I can't find any examples about it. What's the recommended way of get a row from a table in the database?". It has 3 upvotes. Tags listed are `java` and `cursor`. Below the question are links for "share", "edit", and "flag". To the right, a timestamp says "asked Jun 11 '15 at 12:48" and the user name "Foo'r". Below that, the user's reputation is shown as "617 ▾ 5 ▾ 18".

# Pilot Study Task Design

The screenshot shows a Stack Overflow question titled "How do you get a row from a database in Java?". The question has 3 upvotes and tags for `java` and `cursor`. The user asks about using the `Cursor` class from the `android.database` package.

**Source Program:** MySpaghettiCode.java

```
15 String QUERY = "SELECT id, title, year,  
16     int COLUMN_INDEX_ID = 0;  
17     int COLUMN_INDEX_TITLE = 1;  
18     int COLUMN_INDEX_YEAR = 2;  
19     int COLUMN_INDEX_NUM_PAGES = 3;  
20     boolean DEBUG = true;  
21  
22     Database database = new Database("lou",  
23     Cursor cursor = database.cursor();  
24     Booklist booklist = new Booklist();  
25     List titles = new ArrayList();  
26  
27     try {  
28  
29         cursor.execute(QUERY);  
30         boolean finished = false;  
31  
32         if (cursor.rowCount() > 0) {  
33             while (!finished) {  
34                 cursor.moveToFirst();  
35                 String title = cursor.getString(COLUMN_INDEX_TITLE);  
36                 titles.add(title);  
37                 if (cursor.isLast()) {  
38                     finished = true;  
39                 } else {  
40                     cursor.moveToNext();  
41                 }  
42             }  
43         }  
44     } catch (Exception e) {  
45         Log.e("Database Error", e.getMessage());  
46     }  
47 }
```

**Their Example:** ExtractedExample.java

```
1 public class ExtractedExample {  
2  
3     public static void main(String[] args) {  
4  
5         Cursor cursor = database.cursor();  
6         List titles = new ArrayList();  
7         try {  
8             cursor.execute(QUERY);  
9             cursor.fetchone();  
10            String title =  
11                titles.add(title);  
12        } catch (Connecti  
13    }  
14  
15 }  
16  
17 }
```

A context menu is open over the line `String title =` in the `ExtractedExample.java` code, with options "Add code" and "Set value" visible. A tooltip "Line 15" is shown near the cursor.

*Their Example*

## **High-Level Utility of CodeScoop Tool**

18 / 19 participants would prefer to use CodeScoop instead of a text editor in the future.

16 / 19 participants successfully extracted an example with CodeScoop, vs. 11 / 19 with the text editor.

# **Comparing Scoop Length to Slice Length**

<b>Task</b>	<b>Scoop Length</b>	<b>Slice Length</b>
1	22.5	22
2	21	37
3	36	101

## Quick Fixes Are Useful!

"[CodeScoop] did a lot of the grueling work for me, such as importing any libraries or packages that I needed to work with."

"[CodeScoop] saved me the trouble of having to go through and find things like undeclared variables, missing import statements, and unchecked exceptions, which prevented my [...] code from compiling [in the baseline text editor]."

## **Fixes Anchored In the Source Program Are Useful Too**

"For me, the features of highest importance were making sure that my code would compile and run with no important left-out lines."

"[CodeScoop] fills in a lot of things that people usually don't really think about (exceptions, variables/constants) and saves a lot of time spent just searching and copy/pasting."

"Often the hardest part about writing code is finding variables and the relationships they have with the other parts of the code in the sea of text that is a program."

# Annotated Examples from CodeScoop Study

For each example that a participant produced with CodeScoop, we display the example with annotations of how it was constructed.

The marks in the left gutter indicate author interactions. There are three types of interactions:

- 1 An author's first code selections when starting CodeScoop.
- Additional lines added to the example, without any prompting from CodeScoop.
- 💡 Lines an author included in response to a suggestion from CodeScoop.

The color of a line indicates the source of the line:

- Boilerplate: this code shows up in every example so the example can compile.
- Automatic: CodeScoop inferred that this line was required, and added it automatically.
- Prompted: The participant included these lines when reviewing a prompt from CodeScoop .
- Manual: The participant included these lines without any prompting.

## Task 1, Participant 18

```
import org.acme.database.Database;           automatic import  
import org.acme.database.Cursor;            automatic import  
import org.acme.database.Book;              automatic import  
import org.acme.database.ConnectionException; automatic import
```

```
public class ExtractedExample {           boilerplate
```

```
    public static void main(String[] args) throws ConnectionException {   boilerplate + prompted throws
```

```
        int COLUMN_INDEX_ID = 0;           prompted selection (def)  
        int COLUMN_INDEX_TITLE = 1;         prompted selection (def)  
        int COLUMN_INDEX_YEAR = 2;          prompted selection (def)  
        int COLUMN_INDEX_NUM_PAGES = 3;    prompted selection (def)
```

```
        Database database = new Database("lou", "PA$$W0RD", "https://acme-books.com/db");  initial selection
```

```
        Cursor cursor = database.cursor();           selection
```

```
        cursor.execute("SELECT id, title, year, num_pages FROM table WHERE title LIKE '%romance%'");  prompted selection (use)
```

```
        cursor.fetchone();           prompted selection (use)  
        int id = cursor.getInt(COLUMN_INDEX_ID);  prompted selection (use)  
        String title = cursor.getString(COLUMN_INDEX_TITLE);  prompted selection (use)  
        int year = cursor.getInt(COLUMN_INDEX_YEAR);  prompted selection (use)  
        int num_pages = cursor.getInt(COLUMN_INDEX_NUM_PAGES);  prompted selection (def)
```

```
        Book book = new Book(id, title, year, num_pages);           selection
```

```
        System.out.println(title);           add print statement
```

```
    }           boilerplate
```

```
}           boilerplate
```

The labels in the right gutter are fine-grained descriptions each line's source. There are three variants of *prompted selections*:

- def: adding code to define a variable
- use: adding a previous use of a variable
- control: adding a control structure that surrounds a statement
- throws: throwing an exception from the main method signature

A line is generated with the "add print statement" label when an author clicks the "Print" with a variable name selected.

Where an author replaced an undefined variable with a literal, the literal is **highlighted in green, underlined, and bolded**.
